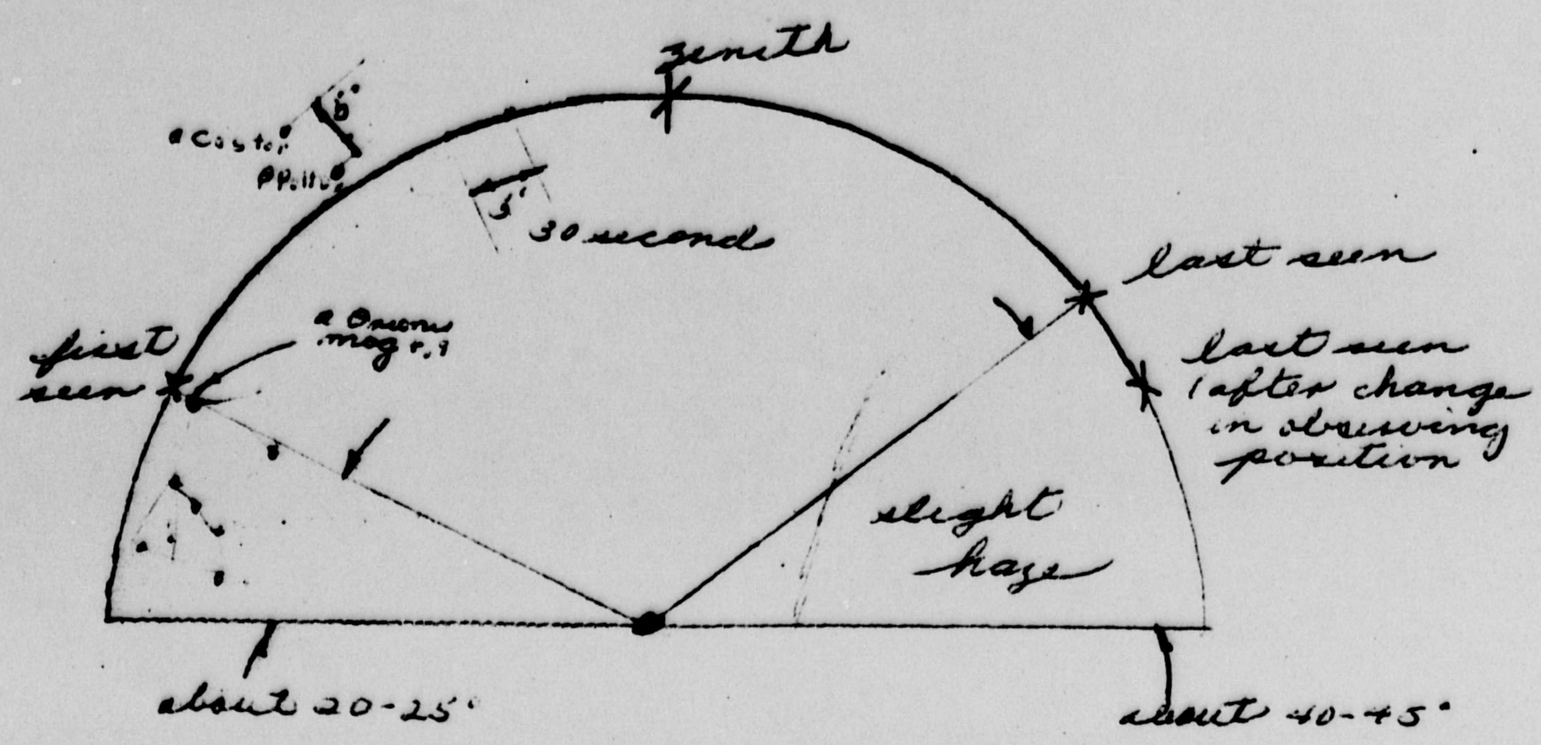
* I measured 5' using a+B Demon as reference and a watch with a second hand (time was 5 sec for 5 degrees)
* 1 optical point (3 x 4" refractor, Tasco, made in Japan)

7:35 PM EST. April 14, 1965



① magnitude = +.5, no variations
② angular velocity = 10° per minute * top
③ color = undefinite, maybe orange-white
④ diffraction pattern = 1 optical point * top
⑤ movement = steady without fluctuations in direction
⑥ seeing - slight cirrus cover, fairly good

Dear Sirs
Tonight, my brother and I (we are both ameteur astronomers) saw something in the sky. I first thought it was a satellite, but it was too bright and too late for it to be one. We are very interested in what we saw. Any explanation would be appreciated

Sincerely,
