AIR INTELLIGENCE INFORMATION REPORT		
SUBJECT Unknown Tracks	ATTN: 1	
AREA REPORTED ON Pacific Northwest	FROM (Agency) Headquarters, 25th Air Division (Defense)	
DATE OF REPORT 16 May 53	DATE OF INFORMATION 13 May 53	EVALUATION A-1
PREPARED BY (Officer) Major Neil A. Vosburgh, USAF	SOURCE 25th Air Division (Defense)	
REFERENCES (Control number, directive, previous report, etc., as applicable)		

SUMMARY: (Enter concise summary of report. Give significance in final one-sentence paragraph. List inclosures at lower left. Begin text of report on AF Form 112-Part II.)

A summary of operations and investigative action with conclusions is submitted on Unknown Tracks B-14-G and B-97-G 13 May 1953.

NEIL A. VOSBURGH

Hqs. 25th Air Division (Def)

SECTION I (B-97-G) 13 MAY 1953

1. Target B-97-G, originating in Pacific ADIZ in KB 5255 at 0415Z hours, heading 340° with 6,000 feet altitude and estimated 90 knots ground speed. Altitude and ground speed remained same throughout course.

2. Pronto Red (1 AI aircraft) was scrambled at 0433Z and was unsuccessful - he could not get a visual on the unknown.

3. Sixpence White (2 Non-AI aircraft vectored in on target) were also unsuccessful.

4. Inclosure #1 is a statement by Captain S. D. Tate and Inclosure #2 is a statement by 2nd Lt D. L. Rodgers. Officers were Pronto Red crew.

5. GCI Director was Captain D. V. Jensen, Station P-57.

6. Inclosure #3 is a chart containing diagram of the activity. Also included is location of balloon mentioned in Section III, paragraph 4, this report.

SECTION II (B-14-G) 13 MAY 1953

1. Target B-14-G, originating in Pacific ADIZ in KB 4848 at 0456Z hours, heading 340° with 6,000 feet altitude and estimated 80 knots ground speed. Altitude and speed remained same throughout course.

2. Pronto Blue (1 AI aircraft) scrambled at 0528Z hours and Pronto White (1 AI aircraft) scrambled at 0508Z hours. Captain D. Jarrett (Pronto Blue) and 1st Lt A. Young (Pronto White) both of 317th Fighter Interceptor Squadron were Intercept Pilots. Pronto White had to abort due to radar trouble. Pronto Blue searched area but could not find the Bogie.

3. GCI Director was Captain D. V. Jensen.

4. Inclosure #4 is a chart containing diagram of the activity.

SECTION III OTHER PERTINENT FACTORS

1. In answer to query, Coast Guard vessels reported sea swells as moving on a course of 050° with swells 9½ feet high having sharp breaking crests moving in at 8 second intervals. Surface winds from North at 4 knots. No visuals on unknowns by three Coast Guard vessels in area. Did see and hear jets.

2. Coast Guard, Navy, RCAF and AMIS were coordinated with. All reported no air activity in area. MST reported large vessel in area which was located by radar.

3. Neah Bay could at no time paint the unknowns but was painting friendly aircraft.

(CLASSIFICATION) **UNCLASSIFIED**
AIR INTELLIGENCE INFORMATION REPORT

FROM (Agency)	REPORT NO.	PAGE	OF	PAGES
Hqs, 25th Air Division (Def)	IR-25AD-2-53W 160553	2	3	

4. Moby Dick Project at Tillamook was checked for balloon activity. One balloon was released at Tillamook on Monday evening and moved to ND 5010 Tuesday A.M. It hovered there at 55,000 feet for few hours until pressure area switched and balloon moved in opposite direction to LA 5000 at 0530Z hours, 13 May 1953.

5. Wind was from NE at 5,000 feet, 20 knots.

6. A Coast Guard radio operator at Westport, Washington reported receiving CW transmissions on 500 kcs that were very weak and unintelligible. Transmissions were intermittent lasting from 30 seconds to 1½ minutes, beginning just prior to 0500Z hours and ending shortly after 0600Z hours. They were also heard by Department of Transport, Port Hardy Radio Range Station, Vancouver Island. No bearing could be obtained due to weak signal. The FCC monitoring station at Portland was queried as to receipt and reported negative; however, they had been monitoring 500 kcs. The Coast Guard radio operator reported that he thought that there were three different transmitters involved in the signals he was receiving and that it sounded like they were using a technique that can be utilized for homing to effect a rendezvous.

7. Major Deckert, Operations Officer of 317th Fighter Interceptor Squadron was sent out in a B-25 around 2300 hours PST. He searched within a 200 mile radius for surface vessels capable of launching or carrying small aircraft. All ships located were determined to be friendly. Visual surveillance was accomplished on several ships after daybreak. On headings of 210° Major Deckert received what is considered to be sea return on radar. On reciprocal (030) he received no pickup. On 210° he was flying directly into (against) the 9½ feet high swells. The swells were crested, thus forming a cup sufficient enough to reflect the radar energy. On the reciprocal course the aircraft was flying with the swells, the crests breaking away from him. This would appear to explain that there would not be enough surface at proper angle to reflect the radar energy.

8. There were numerous fishing boats in the area which were painted by the AI interceptors, the B-25 and by P-44. AC + W

SECTION IV DISCUSSION

1. A study of the alignment of plots provided by station P-57 on these tracks and the report from personnel at the station that the blips looked normal and did not resemble wave blips, leads one to conclude that these were airborne objects. This conclusion can be further substantiated when considering that the sea swell was running in a direction that would result in a very shallow contact angle between the beamed energy and the face of the swells in the vicinity of the unknowns. Therefore, little or no radar energy would be reflected back to the receiving system of the ground station. This conclusion is further substantiated by the results obtained from AI radar when on certain headings during this time period.

2. The fact that station P-44 was unable to pick up these tracks when they were within the surveillance capability of their station refutes the conclusion, to some extent, that these were airborne objects. P-44 had completed their weekly maintenance that morning and the set was painting friendly air traffic and numerous fishing boats and some ocean vessels.

3. At 0400Z a radio sonde observation report from Tatoosh Island (Neah Bay) reported a six degree temperature inversion between 1500 and 1700 feet MSL. This factor accounts for P-44 receiving strong returns on ships well out to sea. It was determined during the research calibration tests conducted at P-57 by personnel from USAF, Research-Development Command and University of Texas, that unusual phenomena can and will occur during inversions which can have varied results on radar energy. The energy may be reflected, null areas may develop and blips may appear on scopes when actually no airborne object is present at that location. These specialists were unable to provide proven criteria, at that time, for practical application by the AC&W system. It is noted that site P-44 was below the level of the existing inversion and that if the inversion's altitude was 1500 to 1700 feet in the vicinity of P-57, that site equipment was above the inversion. Such a condition may have developed a null area for P-44 at the Bogey's altitude or P-57 may have been receiving energy reflected from a localized unusual atmospheric condition. Note Captain Tate's comments (Inclosure #1) about target's actions at 2000 feet.

4. The Westport Coast Guard station is located at LB 5253. The unknown tracks were within 50 to 100 miles of this station during the time the radio operator was receiving transmissions on 500 kcs. Coast Guard Headquarters at Seattle provided the ADCC information regarding these signals because of ADCC controller's previous request for reports of visual sightings by Coast Guard vessels known to be in vicinity of Track B-97. Portland FCC Monitor Station's inability to read signals on 500 kcs could be attributed to weak signal strength.

SECTION V CONCLUSION

1. This Headquarters is unable to further evaluate these tracks.
2. No firm conclusions can be reached as to identity of subject tracks.

S T A T E M E N T

At approximately 0633Z we (Pronto Red) were scrambled after an unknown --- Vector 270, A 20. When we were 15 miles past Shelton we contacted Chancellor and given a Vector of 250, Bogey 12 o'clock, 70 mi. At that time we heard Chancellor trying to work Sixpence White onto the Bogey without success. Chancellor gave the Bogey's approximate altitude as 6 A, so when we were 20 miles out we started a descent to 5,000 feet. As we closed within 4 miles, my radio operator said he was picking up something that looked like ground return at that range; however, we found nothing. CCI again brought us in on the Bogey and the radio operator got intermittent contacts and although we throttled right back to 180 K, we overshot the target. The radio operator on the next pass determined that the target was slightly below us so we dropped down to 2,000 feet. He then got some good contacts plus lock-on and as we closed the target broke up into two or three targets, one passing to the port, one slightly starboard and one dead ahead. We closed to zero range and saw nothing. Due to the action and appearance of the targets, we determined that they were probably chaff. We spent over an hour in the area and got many contacts and lock-ons. As time passed the targets appeared to lose altitude and we looked for them on the surface of the water at 200 feet altitude, using our landing lights. The targets seem to have no movement of their own as we had a large over-take speed on all. If they had been solid targets, we would have seen or collided with some. Two boats in the area we picked up clearly and easily with our weapon.

STATEMENT

As soon as we were airborne I started checking the radar. The set looked good as the ground return was very sharp and distinct. After passing the coastline I picked up a large group of targets, close together making a continuous blob as ground return does. These targets were approximately 12,000 - 15,000 yards out. Chancellor continued to vector us on into the target and when we got into 6,000 - 8,000 yards the individual targets became distinct. They were below us, below 5,000 - 6,000 feet. We throttled right back to 180 - 200 knots and obtained a lock on, overtake over 100 knots. We then went into a hard port turn and broke lock, losing contact at approximately 400 - 500 yards. We flew through, around and locked on several of these contacts. We also made contact with a number of ships and experienced no difficulty getting a visual on them. We believe these contacts were chaff.
